

Claims

We Claim:

5 1. An optical switch disposed at an intersection of two waveguides comprising:

 a trench defined by two sidewalls and a trench floor surface extending across said intersection of said two waveguides;

10 a first electrode disposed near one of said two sidewalls and a second electrode disposed near said trench floor surface of said trench;

15 an electrolytic solution filled in said trench wherein said electrolytic solution containing cations of an electro-depositing mirror metal for responding to an electrical field applied to said first and second electrodes to form an optical reflective surface on one of said sidewalls for reflecting an optical signal from one of said two waveguides to another one of said two waveguides.

2. The optical switch of claim 1 wherein:

20 said electrolytic solution further includes at least one halide and/or pseudohalide compound having cations that are not electroactive in a voltage range applied to said electrodes.

3. The optical switch of claim 2 wherein:

25 a ratio of a total molar concentration of said halide and/or pseudohalide anions representing an total aggregate of anions originating from said halide and/or pseudohalide compound and anions originating from said source of said cations of said electro-depositing mirror material, to a total molar concentration of said cations of said electro-depositing mirror material being greater than a ratio of six to one.

40000000.000000

4. The optical switch of claim 1 further comprising:
an electromagnetic means for applying said electric field to
said electrodes for actuating said optical switch.
5. The optical switch of claim 4 wherein:
said electromagnetic means is provided for applying a
negative electric field to one said electrodes near one of said
sidewalls for actuating said optical switch.
6. The optical switch of claim 4 wherein:
said electromagnetic means is provided for applying a
negative electric field to one said electrodes near said trench
floor surface for deactivating said optical switch.
7. The optical switch of claim 1 further comprising:
an antireflective layer formed on said sidewalls.
8. The optical switch of claim 5 wherein:
said electromagnetic means is further provided for applying
a positive electric field to one said electrodes near said
trench floor surface for enhancing an operation of actuating
said optical switch.
9. The optical switch of claim 6 wherein:
said electromagnetic means is further provided for applying
a positive electric field to one said electrodes near one of said
sidewalls for enhancing an operation of deactivating said
optical switch.
10. The optical switch of claim 1 wherein:
said electrodes are optical transmissive electrodes.

5

12. An optical device disposed in a trench defined by optical transmissive trench sidewalls comprising:

10

said medium property includes an electro-magnetically controllable ion-deposition on said trench sidewalls for controlling a reflective/transmissive optical path through said trench sidewalls.

15

20

an electrode disposed near said trench sidewalls for applying an electromagnetic field on said medium for controlling said medium property.

25

an electrode disposed near said trench sidewalls for applying an electromagnetic field on said medium for controlling said electro-magnetically controllable ion-deposition on said trench sidewalls for controlling a reflective/transmissive optical path through said trench sidewalls.

THE UNIVERSITY OF CHICAGO

17. The optical device of claim 16 further comprising:

a second electrode disposed near a trench floor surface of said trench for applying a second electromagnetic field on said medium for controlling said electro-magnetically controllable ion-deposition on said trench floor surface.

5

18. The optical device of claim 12 wherein:

said medium comprising an electrolytic solution filled in said trench wherein said electrolytic solution containing cations of an electro-depositing mirror metal for responding to an electrical field applied to said medium.

10

19. The optical device of claim 18 wherein:

said electrolytic solution further includes at least one halide and/or pseudohalide compound having cations that are not electroactive in a voltage range applied to said electrodes.

15

20. The optical device of claim 18 wherein:

a ratio of a total molar concentration of said halide and/or pseudohalide anions representing an total aggregate of anions originating from said halide and/or pseudohalide compound and anions originating from said source of said cations of said electro-depositing mirror material, to a total molar concentration of said cations of said electro-depositing mirror material being greater than a ratio of six to one.

20

21. The optical device of claim 13 wherein:

said electromagnetic means is provided for applying a negative electric field to one said electrodes near one of said sidewalls for actuating said optical device.

25

40068263.000502

22. The optical device of claim 17 wherein:

said electromagnetic means is provided for applying a negative electric field to one said electrodes near said trench floor surface for deactivating said optical device.
23. The optical device of claim 12 further comprising:

an antireflective layer formed on said sidewalls.
24. The optical device of claim 16 wherein:

said electrodes are optical transmissive electrodes.
25. The optical device of claim 12 further comprising:

a substrate for supporting said optical device.
26. A method for forming an optical device in a trench defined by optical transmissive trench sidewalls comprising:

filling said trench with a medium having an electro-magnetically controllable medium property for controlling an optical transmission through said trench and said trench sidewalls.
27. The method of claim 26 wherein:

said step of filling said trench with said medium is a step of filling said trench with a medium having a property of electro-magnetically controllable ion-deposition on said trench sidewalls for controlling a reflective/transmissive optical path through said trench sidewalls.
28. The method of claim 26 further comprising:

applying an electromagnetic field on said medium for controlling said medium property for controlling said optical path.

disposing an electrode near said trench sidewalls for applying an electromagnetic field on said medium for controlling said medium property.

disposing an electrode near said trench sidewalls for applying an electromagnetic field on said medium for controlling said electro-magnetically controllable ion-deposition on said trench sidewalls for controlling a reflective/transmissive optical path through said trench sidewalls.

disposing a second electrode near a trench floor surface of said trench for applying a second electromagnetic field on said medium for controlling said electro-magnetically controllable ion-deposition on said trench floor surface.

said step of filling said trench with said medium is a step of filling said trench with a said comprising an electrolytic solution containing cations of an electro-depositing mirror metal for responding to an electrical field applied to said medium.
